# Figure 3:  Interpretation
# The bar chart illustrates the distribution of tweet sentiments per day
# from July 14 to July 21, 2020. Negative sentiments consistently appear
# as the most dominant category, peaking notably on July 15 and July 21.
# Neutral tweets show relatively stable counts throughout the observed period,
# while positive tweets remain lower but display minor increases on certain days
# such as July 17 and July 20. Overall, the figure indicates that Twitter users
# expressed more negative sentiments during this timeframe compared to neutral
# and positive reactions.
```
